

HIGHLIGHTS OF PRESCRIBING INFORMATION These highlights do not include all the information needed to use EFAVIRENZ, LAMIVUDINE AND TENOFOVIR DISOPROXIL FUMARATE TABLETS safely and effectively. See full prescribing information fo EFAVIRENZ, LAMIVUDINE AND TENOFOVIR DISOPROXIL FUMARATE EFAVIRENZ, LAMIVUDINE AND TENOFOVIR DISOPROXIL FUMARATE

Initial U.S. Approval: 2018 WARNING: POST TREATMENT ACUTE EXACERBATIONS OF See full prescribing information for complete boxed warning.

Severe acute exacerbations of hepatitis B have been reported in patients who are co-infected with HBV and human immunodeficiency virus (HIV-1) and have discontinued lamivudine and tenofovir disoproxil fumarate. Monito

initiate anti-hepatitis B treatment. (5.1) Warnings and Precautions (5.1, 5.2, 5.3, 5.4, 5.6, 5.13, 5.14) 10/2019 Ribavirin-Based Regimens (previous 5.10) 10/2019 ----INDICATIONS AND USAGE-Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are three-drug combination of efavirenz (EFV), a non-nucleoside reverse

transcriptase inhibitor, and lamivudine (3TC) and tenofovir disoproxi  $fumarate \ (TDF), both \ nucleo(t) side \ reverse \ transcript as e \ inhibitors \ and \\ \bullet$ are indicated as a complete regimen for the treatment of human nmunodeficiency virus type 1 (HIV-1) infection in adult and pediatric patients weighing at least 40 kg. (1) ----DOSAGE AND ADMINISTRATION---

 Testing: Prior to initiation and during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, patients should be tested for hepatitis B virus infection, and estimated creatinine clearance, urine glucose, and urine protein should be obtained. (2.1)

 Recommended dose: One tablet taken orally once daily on an empty stomach, preferably at bedtime. (2.2) Renal Impairment: Not recommended in patients with CrCL less than 50 mL/min or patients with end-stage renal disease requiring hemodialysis. (2.3)

Hepatic Impairment: Not recommended for patients with

moderate or severe hepatic impairment. Use caution in patients with mild hepatic impairment. (2.4) ----DOSAGE FORMS AND STRENGTHS--Tablets: 600 mg efavirenz, 300 mg lamivudine and 300 mg tenofovir

disoproxil fumarate (equivalent to 245 mg of tenofovir disoproxil). (3) Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are contraindicated in patients with previous hypersensitivity (e.g., Stevens-Johnson syndrome, erythema multiforme, or toxic

kin eruptions) to any of the components of this product. (4) Coadministration with elbasvir/grazoprevir. (4) --WARNINGS AND PRECAUTIONS---• Lactic Acidosis/Severe Hepatomegaly with Steatosis: • Discontinue treatment in patients who develop symptoms or laboratory findings suggestive of lactic acidosis or pronounced epatotoxicity. (5.2) New Onset or Worsening Renal Impairment: Can include acute renal failure and Fanconi syndrome. Avoid administering

efavirenz, lamivudine and tenofovir disoproxil fumarate tablets with concurrent or recent use of nephrotoxic drugs. (5.4) Serious Psychiatric Symptoms: Immediate medical evaluation is recommended for serious psychiatric symptoms such as severe depression or suicidal ideation. (5.5)

Nervous System Symptoms (NSS): NSS are frequent, usually begin 1 to 2 days after initiating therapy and resolve in 2 to 4 weeks. Dosing at bedtime may improve tolerability. NSS are not predictive of onset of psychiatric symptoms. (5.6) Rash: Rash usually begins within 1 to 2 weeks after initiating therapy and resolves within 4 weeks. Discontinue if severe rash

develops. (5.8) Hepatotoxicity: Monitor liver function tests before and during treatment in patients with underlying hepatic disease, including hepatitis B or C coinfection, marked transaminase elevations, o who are taking medications associated with liver toxicity. Among eported cases of hepatic failure, a few occurred in patients with no pre-existing hepatic disease. (5.9, 8.7) Pancreatitis: Use with caution in pediatric patients with a history of pancreatitis or other significant risk factors for pancreatitis.

Discontinue efavirenz, lamivudine and tenofovir disoproxil fumarate as clinically appropriate. (5.10) Convulsions: Use caution in patients with a history of seizures Lipids: Total cholesterol and triglyceride elevations. Monitor before therapy and periodically thereafter. (5.12) Decreases in Bone Mineral Density (BMD): Observed in HIVinfected patients. Consider assessment of BMD in patients with a history of pathologic fracture or other risk factors for osteoporosis or bone loss. (5.13) Immune Reconstitution Syndrome: Observed in HIV-infected patients. May necessitate further evaluation and treatment. (5.14) Redistribution/Accumulation of Body Fat: Observed in HIV-

--ADVERSE REACTIONS--Most common adverse reactions are impaired concentration, abnormal dreams, headache, nausea, malaise and fatigue, nasal signs and symptoms, diarrhea, rash, dizziness, insomnia, pain, depression, asthenia, and cough. (6)

infected patients receiving antiretroviral combination therapy.

To report SUSPECTED ADVERSE REACTIONS, contact Laurus Generics Inc. at 1-833-3-LAURUS (1-833-352-8787) or FDA at 1-800--- DRUG INTERACTIONS

Efavirenz, lamivudine and tenofovir disoproxil fumarate should not be administered with other antiretroviral medications for the treatment of HIV-1 infection, (7.1) Coadministration of efavirenz, lamivudine and tenofovir disoproxil fumarate can alter the concentrations of other drugs and other drugs may alter the concentration of efavirenz, amivudine and tenofovir disoproxil fumarate. The potential for drug-drug interactions should be considered before and during

therapy. (5.3, 7) ---USE IN SPECIFIC POPULATIONS--Pregnancy: Women should avoid pregnancy during EFV therapy, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, and for 12 weeks after discontinuation. (5.7, Lactation: Breastfeeding not recommended due to potential for HIV transmission. (8.2)

Females and Males of Reproductive Potential: Pregnancy testing and contraception are recommended. (8.3) See 17 for PATIENT COUNSELING INFORMATION and FDA-approved Revised: 11/2019

FULL PRESCRIBING INFORMATION WARNING: POST TREATMENT ACUTE EXACERBATIONS OF HEPATITIS B Severe acute exacerbations of hepatitis B have been reported in patients who are co-infected with hepatitis B virus (HBV) and human immunodefficiency virus (HIV-1) and have discontinued lamivudine or tenofovir disoproxil fumarate, two components of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Monitor hepatic function closely in these patients and, if appropriate, initiate antihepatitis B treatment [see Warnings and Precautions (5.1)].

Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are indicated as a complete regimen for the treatment of human immunodeficiency virus type 1 (HIV-1) infection in adult and pediatric patients weighing at least 40 kg. 2 DOSAGE AND ADMINISTRATION

 $2.1 \quad \text{Testing Prior to Initiation and During Treatment with Efavirenz, Lamivudine and Tenofovir Disoproxil Fumarate Tablets}$ Prior to initiation of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, test patients for hepatitis B virus infection [see Warnings and It is recommended that serum creatinine, serum phosphorus, estimated creatinine clearance, urine glucose, and urine protein be assessed before initiating efavirenz, lamivudine and tenofovir disoproxil fumarate tablets and during therapy in all patients as clinically appropriate [see Warnings and Precautions (5.4)1.

Monitor hepatic function prior to and during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets [see Warnings and Precautions (5.9)]. 2.2 Recommended Dosage for Adult and Pediatric Patients Weighing at Least 40 kg
Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are a three-drug fixed-dose combination product containing 600 mg of efavirenz (EFV), 300 mg of lamivudine (3TC), and 300 mg of tenofovir disoproxil fumarate (TDF). The recommended dosage of favirenz, lamivudine and tenofovir disoproxil fumarate tablets in HIV-1-infected adults and pediatric patients who weigh at least 40 kg, and can swallow a solid tablet, is one

tablet taken orally once daily. Efavirenz, lamiyudine and tenofovir disoproxil fumarate tablets should be taken on an empty stomach, preferably at bedtime. Dosing at bedtime may improve the tolerability of nervous system symptoms [see Warnings and Precautions (5.6) and Adverse Reactions 2.3 Not Recommended in Renal Impairment
Because efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are a fixed-dose combination tablet and cannot be dose adjusted, they are

not recommended for patients with impaired renal function (creatinine clearance less than 50 mL/min) or patients with end-stage renal disease (ESRD) requiring hemodialysis [see Use in Specific Populations (8.6)]. 2.4 Not Recommended in Moderate to Severe Hepatic Impairment
Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are not recommended in patients with moderate or severe hepatic impairment (Child-Pugh B or C) [see Warnings and Precautions (5.9) and Use in Specific Populations (8.7)]. 3 DOSAGE FORMS AND STRENGTHS

Tablets: 600 mg of efavirenz, 300 mg of lamivudine, and 300 mg of tenofovir disoproxil fumarate (equivalent to 245 mg of tenofovir disoproxil). The tablets are white colored, capsule shaped, biconvex, film coated tablets, debossed with 'L65' on one side and plain on the other side. 4 CONTRAINDICATIONS

Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are contraindicated: • in patients with a previous hypersensitivity reaction (e.g., Stevens-Johnson syndrome, erythema multiforme, or toxic skin eruptions) to any

of the components contained in the formulation [see Warnings and Precautions (5.3)].

when coadministered with elbasvir and grazoprevir [see Warnings and Precautions (5.3)] and Drug Interactions (7.5)]. 5.1 Severe Acute Exacerbation of Hepatitis B in Patients Coinfected with HIV-1 and HBV Posttreatment Exacerbations of Hepatitis: All patients with HIV-1 should be tested for the presence of chronic hepatitis B virus (HBV) before initiating antiretroviral therapy [see Dosage and Administration (2.1)]. Discontinuation of anti-HBV therapy, including 3TC and TDF, may be

associated with severe acute exacerbations of hepatitis B. Patients infected with HBV who discontinue efavirenz, lamivudine and tenofovir disoproxil fumarate should be closely monitored with both clinical and laboratory follow-up for at least several months after stopping treatment. If ppropriate, resumption of anti-hepatitis B therapy may be warranted. Important Differences Among Lamivudine-Containing Products: Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets contain a higher dose of the same active ingredient, 3TC, than EPIVIR-HBV® tablets. EPIVIR-HBV was developed for patients with chronic hepatitis B. The

formulation and dosage of STC in EPIVIR-HBV are not appropriate for patients co-infected with HIV-1 and HBV. Safety and efficacy of STC have not been established for treatment of chronic hepatitis B in patients co-infected with HIV-1 and HBV. f treatment with EPIVIR-HBV, TDF, or a tenofovir alafenamide (TAF)-containing product is prescribed for chronic hepatitis B for a patient with inrecognized or untreated HIV-1 infection, rapid emergence of HIV-1 resistance is likely to result because of the subtherapeutic dose and the opriateness of monotherapy HIV-1 treatment. 5.2 Lactic Acidosis and Severe Hepatomegaly with Steatosis

Lactic acidosis and severe hepatomegally with steatosis, including fatal cases, have been reported with the use of nucleoside analogs and other antiretrovirals. Female sex and obesity may be risk factors for the development of lactic acidosis and severe hepatomegally with steatosis in patients treated with antiretroviral nucleoside analogues. Treatment should be suspended in any patient who develops clinical or laboratory findings suggestive of lactic acidosis or pronounced hepatotoxicity, which may include hepatomegaly and steatosis even in the absence of marked  $5.3 \quad Risk of Adverse \, Reactions \, or \, Loss \, of \, Virologic \, Response \, Due \, to \, Drug \, Interactions$ 

The concomitant use of efavirenz, lamivudine and tenofovir disoproxil fumarate and other drugs may result in known or potentially significant drug nteractions, some of which may lead to [see Contraindications (4) and Drug Interactions (7.5)]: Loss of therapeutic effect of efavirenz, lamivudine and tenofovir disoproxil fumarate and possible development of resistance Possible clinically significant adverse reactions from greater exposures of concomitant drugs.

See Table 3 for steps to prevent or manage these possible and known significant drug interactions, including dosing recommendations. Consider the potential for drug interactions prior to and during theraphy with efavirenz, lamivudine and tenofovir disoproxil fumarate; review concomitant medications during therapy with efavirenz, lamivudine and tenofovir disoproxil fumarate; and monitor for the adverse reactions associated with the

5.4 New Onset or Worsening Renal Impairment TDF, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets is principally eliminated by the kidney. Renal impairment including cases of acute renal failure and Fanconi syndrome (renal tubular injury with severe hypophosphatemia), has been reported with the use of

Prior to initiation and during use of efavirenz, lamivudine and tenofovir disoproxil fumarate, on a clinically appropriate schedule, assess serum creatinine, estimated creatinine clearance, urine glucose, and urine protein in all patients. Avoid efavirenz, lamivudine and tenofovir disoproxil furmarate with concurrent or recent use of a nephrotoxic agent (e.g., high-dose or multiple nonsteroidal anti-inflammatory drugs (NSAIDs)) [see Drug Interactions (7.3)]. Cases of acute renal failure after initiation of high-dose or multiple NSAIDs have been reported in HIV-infected patients with risk factors for renal dysfunction who appeared stable on TDF. Some patients required pitalization and renal replacement therapy. Alternatives to NSAIDs should be considered, if needed, in patients at risk for renal dysfunction. tubulopathy and should prompt an evaluation of renal function in patients at risk of renal dysfunction.

serious psychiatric adverse experiences have been reported in patients treated with EFV, a component of efavirenz, lamivudine and tenofovi disoproxil fumarate tablets. In controlled trials of 1,008 patients treated with regimens containing EFV for a mean of 2.1 years and 635 patients treated with control regimens for a mean of 1.5 years, the frequency (regardless of causality) of specific serious psychiatric events among patients

 $who \ received \ EFV \ or \ control \ regimens, \ respectively, \ were \ severe \ depression \ (2.4\%, \ 0.9\%), \ suicidal \ ideation \ (0.7\%, \ 0.3\%), \ nonfatal \ suicide$ attempts (0.5%, 0), aggressive behavior (0.4%, 0.5%), paranoid reactions (0.4%, 0.3%), and manic reactions (0.2%, 0.3%). When psychiatric symptoms similar to those noted above were combined and evaluated as a group in a multifactorial analysis of data from a study using EFV 600 mg, reatment with EFV was associated with an increase in the occurrence of these selected psychiatric symptoms. Other factors associated with an ncrease in the occurrence of these psychiatric symptoms were history of injection drug use, psychiatric history, and receipt of psychiatric medication at study entry; similar associations were observed in both the EFV and control treatment groups. In a study using EFV 600 mg, onset of ew serious psychiatric symptoms occurred throughout the study for both EFV-treated and control-treated patients. One percent of EFV-treated patients discontinued or interrupted treatment because of one or more of these selected psychiatric symptoms.

There have also been occasional postmarketing reports of death by suicide, delusions, psychosis- like behavior, although a causal relationship to he use of EFV cannot be determined from these reports [see Adverse Reactions (6.2)]. Postmarketing cases of catatonia have also been reported and may be associated with increased efavirenz exposure. Patients with serious psychiatric adverse experiences should seek immediate medical valuation to assess the possibility that the symptoms may be related to the use of EFV, and if so, to determine whether the risks of continued

therapy outweigh the benefits. 5.6 Nervous System Symptom Fifty-three percent (531/1,008) of patients receiving EFV, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, in controlled trials reported central nervous system symptoms (any grade, regardless of causality) compared to 25% (156/635) of patients receiving control regimens. These symptoms included, but were not limited to, dizziness (28.1% of the 1,008 patients), insomnia (16.3%), impaired concentration (8.3%), somnolence (7.0%), abnormal dreams (6.2%), and hallucinations (1.2%). These symptoms were severe in 2.0% of patients and 2.1% of patients discontinued therapy as a result. These symptoms usually begin during the first or second day of therapy and generally resolve after the first 2 to 4 weeks of therapy. After 4 weeks of therapy, the prevalence of nervous system symptoms of at least moderate severity ranged rom 5% to 9% in patients treated with regimens containing EFV and from 3% to 5% in patients treated with a control regimen. Inform patients that

these common symptoms were likely to improve with continued therapy and were not predictive of subsequent onset of the less frequent psychiatric symptoms [see Warnings and Precautions (5.5)]. Dosing at bedtime may improve the tolerability of these nervous system symptoms [see Dosage and Administration (2.2)] ate-onset neurotoxicity, including ataxia and encephalopathy (impaired consciousness, confusion, psychomotor slowing, psychosis, delirium. nay occur months to years after beginning efavirenz therapy. Some events of late-onset neurotoxicity have occurred in patients with CYP2B6 netic polymorphisms which are associated with increased efavirenz levels despite daily dosages of 600 mg of efavirenz. Patients presenting with signs and symptoms of serious neurologic adverse experiences should be evaluated promptly to assess the possibility that these events may be

lated to efavirenz use, and whether discontinuation of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets is warranted. EFV, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, may cause fetal harm when administered during the first imester to a pregnant woman. Advise females of reproductive potential who are receiving EFV to avoid pregnancy [see Use in Specific Popul

(8.1.8.3)1. 5.8 Skin and Systemic Hypersensitivity Reaction trolled clinical trials, 26% (266/1,008) of patients treated with 600 mg EFV experienced new-onset skin rash compared with 17% (111/635) of patients treated in control groups. Rash associated with blistering, moist desquamation, or ulceration occurred in 0.9% (9/1,008) of patients treated with EFV. The incidence of Grade 4 rash (e.g., erythema multiforme, Stevens- Johnson syndrome) in patients treated with EFV in all studies and expanded access was 0.1%. Rashes are usually mild-to-moderate maculopapular skin eruptions that occur within the first 2 weeks of initiating nonth (median duration, 16 days). The discontinuation rate for rash in clinical trials was 1.7% (17/1.008).

herapy with EFV (median time to onset of rash in adults was 11 days) and, in most patients continuing therapy with EFV, rash resolves within 1 EFV can generally be reinitiated in patients interrupting therapy because of rash. EFV should be discontinued in patients developing severe rash associated with blistering, desquamation, mucosal involvement, or fever. Appropriate antihistamines and/or corticosteroids may improve the tolerability and hasten the resolution of rash. For patients who have had a life-threatening cutaneous reaction (e.g., Stevens-Johnson syndrome),

Postmarketing cases of hepatitis, including fulminant hepatitis progressing to liver failure requiring transplantation or resulting in death, have been reported in patients treated with EFV. Reports have included patients with underlying hepatic disease, including coinfection with hepatitis B or C, d patients without pre-existing hepatic disease or other identifiable risk factors. EFV, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, is not recommended for patients with moderate or severe epatic impairment. Careful monitoring is recommended for patients with mild hepatic impairment receiving EFV [see Adverse Reactions (6.1) and Use in Specific Populations (8.7)]

Monitoring of liver enzymes before and during treatment is recommended for all patients [see Dosage and Administration (2.1)]. Consider scontinuing efavirenz, lamivudine and tenofovir disoproxil fumarate in patients with persistent elevations of serum transaminases to greater than five times the upper limit of the normal range Discontinue efavirenz, lamivudine and tenofovir disoproxil fumarate if elevation of serum transaminases is accompanied by clinical signs or

n pediatric patients with a history of prior antiretroviral nucleoside exposure, a history of pancreatitis, or other significant risk factors for the elopment of pancreatitis, 3TC, a component of efavirenz, lamiyudine and tenofovir disoproxil fumarate tablets, should be used with caution, Treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate should be stopped immediately if clinical signs, symptoms, or laboratory abnormalities suggestive of pancreatitis occur [see Adverse Reactions (6.1)].

5.11 Convulsions Convulsions have been observed in patients receiving EFV, generally in the presence of known medical history of seizures [see Nonclinical Toxicology (13.2)]. Caution should be taken in any patient with a history of seizures. Patients who are receiving concomitant antico medications primarily metabolized by the liver, such as phenytoin and phenobarbital, may require periodic monitoring of plasma levels [see Drug Interactions (7.5)1

Treatment with EFV has resulted in increases in the concentration of total cholesterol and triglycerides. Cholesterol and triglyceride testing should

be performed before initiating EFV therapy and at periodic intervals during therapy. 5.13 Bone Loss and Mineralization Effects Bone Mineral Density (BMD): In clinical trials in HIV-1-infected adults, TDF was associated with slightly greater decreases in BMD and incr biochemical markers of bone metabolism, suggesting increased bone turnover relative to comparators [see Adverse Reactions (6.1)]. Serum parathyroid hormone levels and 1,25 Vitamin D levels were also higher in subjects receiving TDF.

The effects of TDF-associated changes in BMD and biochemical markers on long-term bone health and future fracture risk in adults and pediatric subjects 2 years and older are unknown. The long-term effect of lower spine and total body BMD on skeletal growth in pediatric patients, and in particular, the effects of long-duration exposure in younger children is unknown. Although the effect of supplementation with calcium and vitamin D was not studied, such supplementation may be beneficial. Assessment of BMD should be considered for adult and pediatric patients who have a history of pathologic bone fracture or other risk factors for osteoporosis or one loss. If bone abnormalities are suspected then appropriate consultation should be obtained.

Mineralization Defects: Cases of osteomalacia associated with proximal renal tubulopathy, manifested as bone pain or pain in extremities and which may contribute to fractures, have been reported in association with TDF use [see Adverse Reactions (6.2)]. Arthralgia and muscle pain or weakness have also been reported in cases of proximal renal tubulopathy. Hypophosphatemia and osteomalacia secondary to proximal renal tubulopathy should be considered in patients at risk of renal dysfunction who present with persistent or worsening bone or muscle symptoms while receiving TDF-containing products [see Warnings and Precautions (5.4)].

5.14 Immune Reconstitution Syndrome mmune reconstitution syndrome has been reported in HIV-infected patients treated with combination antiretroviral therapy, including EFV, 3TC, and TDF. During the initial phase of combination antiretroviral treatment, patients whose immune system responds may develop an inflammatory response to indolent or residual opportunistic infections (such as *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jirovecii* pneumonia [PCP], or tuberculosis), which may necessitate further evaluation and treatment. Autoimmune disorders (such as Graves' disease, polymyositis, Guillain-Barre syndrome, and autoimmune hepatitis) have also been reported to occur in the setting of immune reconstitution; however, the time to onset is more variable, and can occur many months after initiation of treatment.

5.15 Fat Redistribution In HIV-infected patients, redistribution/accumulation of body fat including central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, facial wasting, breast enlargement, and "cushingoid appearance" have been observed in patients receiving combination antiretroviral therapy. The mechanism and long-term consequences of these events are currently unknown. A causal relationship has not been established.

QTc prolongation has been observed with the use of EFV [see Drug Interactions (7.2, 7.5) and Clinical Pharmacology (12.2)]. Consider alternatives to products containing EFV when coadministered with a drug with a known risk of Torsade de Pointes or when administered to patients at higher risk of Torsade de Pointes.

6 ADVERSE REACTIONS following adverse reactions are discussed in other sections of the labeling: Exacerbations of Hepatitis B [see Boxed Warning, Warnings and Precautions (5.1)]. Lactic Acidosis/Severe Hepatomegaly with Steatosis [see Warnings and Precautions (5.2)]. New Onset or Worsening Renal Impairment [see Warnings and Precautions (5.4)].

Psychiatric Symptoms [see Warnings and Precautions (5.5)]. Nervous System Symptoms [see Warnings and Precautions (5.6)].

Skin and Systemic Hypersensitivity Reaction [see Warnings and Precautions (5.8)]. Hepatotoxicity [see Warnings and Precautions (5.9)]. Pancreatitis [see Warnings and Precautions (5.10)]. Bone Loss and Mineralization Effects [see Warnings and Precautions (5.13)].

Immune Reconstitution Syndrome [see Warnings and Precautions (5.14)]. Fat Redistribution [see Warnings and Precautions (5.15)]. 6.1 Clinical Trials Experience

Because clinical studies are conducted under widely varying conditions, the adverse reaction rates observed in clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice. **Efavirenz, Lamivudine and Tenofovir Disoproxil Fumarate** Clinical Trials in Treatment-Naïve HIV-1 Infected Adult Subjects

n Trial 903, 600 antiretroviral-naïve subjects received TDF (N = 299) or stavudine (d4T) (N = 301) administered in combination with 3TC and EFV for 144 weeks. The most common adverse reactions were mild to moderate gastrointestinal events and dizziness. Mild adverse reactions (Grade 1) were common with a similar incidence in both arms and included dizziness, diarrhea, and nausea. Table 1 provides the treatment-emergent adverse reactions (Grade 2 to 4) occurring in greater than or equal to 5% of subjects treated in any treatment group. Table 1. Selected Adverse Reactions\*(Grades 2 to 4) Reported in ≥ 5% in Any Treatment Group in Trial 903 (0 to 144 Weeks)

TDF + 3TC + EFV

d4T + 3TC + EFV

	IDF + 310 + EFV	U41+310+EFV
	N = 299	N = 301
Rash event <sup>b</sup>	18%	12%
Headache	14%	17%

Do not take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets if you:

 are allergic to efavirenz, lamivudine, tenofovir disoproxil fumarate, or any of disoproxil fumarate tablets. See the end of this Patient Information leaflet for a ctenofovir disoproxil fumarate tablets.

Changes in Bone Mineral Density: In HIV-1-infected adult subjects in Trial 903, there was a significantly greater mean percentage decrease from baseline in BMD at the lumbar spine in subjects receiving TDF  $\pm$  3TC  $\pm$  EFV (-2.2%  $\pm$  3.9) compared with subjects receiving d4T  $\pm$  3TC  $\pm$  EFV (-1.0%  $\pm$  4.6) through 144 weeks. Changes in BMD at the hip were similar between the two treatment groups (-2.8%  $\pm$  3.5 in the TDF group vs. -2.4%  $\pm$  4.5 in the d4T group). In both groups, the majority of the reduction in BMD occurred in the first 24 to 48 weeks of the trial and this reduction was ough Week 144. Twenty-eight percent of TDF-treated subjects vs. 21% of the d4T-treated subjects lost at least 5% of BMD at the spine or 7% of BMD at the hip. Clinically relevant fractures (excluding fingers and toes) were reported in 4 subjects in the TDF group and 6 subjects in the d4T group. In addition, there were significant increases in biochemical markers of bone metabolism (serum bone-specific alkaline phosphatase erum osteocalcin, serum C telopentide, and urinary N telopentide) and higher serum parathyroid hormone levels and 1,25 Vitamin D levels in the TDF group relative to the d4T group; however, except for bone-specific alkaline phosphatase, these changes resulted in values that remained within the normal range [see Warnings and Precautions (5.13)].

6.2 Postmarketing Experience The following adverse reactions have been identified during post-approval use for each of the individual components of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets (EFV, 3TC, and TDF). Because these reactions are reported voluntarily from a population of unknown size, it is not always possible to reliably estimate their frequency or establish causal relationship to drug exposure. These reactions have been chosen for inclusion due to a combination of their seriousness, frequency of reporting, or potential causal connection to EFV, 3TC, and TDF.

Body as a Whole: allergic reactions, asthenia, redistribution/accumulation of body fat [see Warnings and Precautions (5.15)].

Central and Peripheral Nervous System: abnormal coordination, ataxia, encephalopathy, cerebellar coordination and balance disturbances,

onvulsions, hypoesthesia, paresthesia, neuropathy, tremor, vertigo. Endocrine: gynecomastia. Gastrointestinal: constipation, malabsorption Cardiovascular: flushing, palpitations.

Liver and Biliary System: hepatic enzyme increase, hepatic failure, hepatitis. tabolic and Nutritional: hypercholesterolemia, hypertriglyceridemia. Musculoskeletal: arthralgia, myalgia, myopathy.

Psychiatric: aggressive reactions, agitation, delusions, emotional lability, mania, neurosis, paranoia, psychosis, suicide, catatonia Respiratory: dyspnea. Skin and Appendages: erythema multiforme, photoallergic dermatitis, Stevens-Johnson syndrome

Special Senses: abnormal vision, tinnitus.

Body as a Whole: redistribution/accumulation of body fat [see Warnings and Precautions (5.15)] Endocrine and Metabolic: hyperglycemia. *General:* weakness.

Hemic and Lymphatic: anemia (including pure red cell aplasia and severe anemias progressing on therapy) Hepatic and Pancreatic: lactic acidosis and hepatic steatosis, posttreatment exacerbation of hepatitis B [see Boxed Warning, Warnings and Precautions (5.1. 5.2)1. lypersensitivity: anaphylaxis, urticaria Musculoskeletal: muscle weakness, CPK elevation, rhabdomyolysis.

Skin: Alopecia, pruritus. Tenofovir Disoproxil Fumarate

DRUG INTERACTIONS

Skin and Subcutaneous Tissue Disorders: rash.

ne System Disorders: allergic reaction, including angioedem Metabolism and Nutrition Disorders: lactic acidosis, hypokalemia, hypophosphatemia

Respiratory, Thoracic, and Mediastinal Disorders: dyspnea. Gastrointestinal Disorders: pancreatitis, increased amylase, abdominal pair Renal and Urinary Disorders: renal insufficiency, acute renal failure, renal failure, acute tubular necrosis, Fanconi syndrome, proximal renal tubulopathy, interstitial nephritis (including acute cases), nephrogenic diabetes insipidus, renal insufficiency, increased creatinine, proteinuria, polyuria [see Warnings and Precautions (5.4)]. Hepatobiliary Disorders: hepatic steatosis, hepatitis, increased liver enzymes (most commonly AST, ALT gamma GT).

Musculoskeletal and Connective Tissue Disorders: rhabdomyolysis, osteomalacia (manifested as bone pain and which may contribute to fractures), muscular weakness, myopathy. eneral Disorders and Administration Site Conditions: asthenia The following adverse reactions, listed under the body system headings above, may occur as a consequence of proximal renal tubulopathy: rhabdomyolysis, osteomalacia, hypokalemia, muscular weakness, myopathy, hypophosphatemia

7.1 Not Recommended with Other Antiretroviral Medications Efavirenz, lamivudine and tenofovir disoproxil fumarate is a complete regimen for the treatment of HIV-1 infection; therefore, it should not be Iministered with other antiretroviral medications for treatment of HIV-1 infection.

There is limited information available on the potential for a pharmacodynamic interaction between EFV and drugs that prolong the QTc interval. QTc prolongation has been observed with the use of EFV [see Clinical Pharmacology (12.2)]. Consider alternatives to EFV when coadministered with a Irua with a known risk of Torsade de Pointes. Tenofovir is primarily eliminated by the kidneys [see Clinical Pharmacology (12.3)]. Coadministration of EFV/3TC/TDF with drugs that are eliminated by active tubular secretion may increase concentrations of tenofovir and/or the coadministered drug. Some examples include, but are

not limited to, acyclovir, cidofovir, ganciclovir, valacyclovir, valganciclovir, aminoglycosides (e.g., gentamicin), and high-dose or multiple NSAIDs see Warnings and Precautions (5.4)]. Drugs that decrease renal function may increase concentrations of tenofovir EFV does not bind to cannabinoid receptors. False-positive urine cannabinoid test results have been reported with some screening assays in

uninfected and HIV-infected subjects receiving EFV. Confirmation of positive screening tests for cannabinoids by a more specific method is 7.5 Established and Other Potentially Significant Interactions EFV has been shown in vivo to induce CYP3A and CYP2B6. Other compounds that are substrates of CYP3A or CYP2B6 may have decreased plasma

Drugs that induce CYP3A activity (e.g., phenobarbital, rifampin, rifabutin) would be expected to increase the clearance of EFV resulting in lowered No drug interaction studies have been conducted using efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. However, drug interaction studies have been conducted with the individual components of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets (EFV, 3TC, and TDF) [see Clinical Pharmacology (12.3)]. Drug interactions with FFV are summarized in Table 3 (for pharmacokinetics data see Clinical Pharmacology (12.3 Tables 6 and 7)). This table

Decreased exposure of etonogestrel may be expected. There have been postmarketing reports of contraceptive failure

with etonogestrel in EFV-exposed patients Dose adjustments of the immunosuppressant may be required. Close monitoring of immunosuppressant concentrations for at least 2 weeks Cyclosporine, tacrolimus sirolimus, and others metabolized by CYP3A until stable concentrations are reached) is recommended when starting or stopping treatment with EFV. Narcotic analgesic: Methadone Monitor for signs of methadone withdrawal and increase methadone methadone dose if required to alleviate withdrawal symptoms. \* The interaction between EFV and the drug was evaluated in a clinical study. All other drug interactions shown are predicted This table is not all-inclusive.

7.6 Drugs without Clinically Significant Interactions
No dosage adjustment is recommended when efavirenz, lamivudine and tenofovir disoproxil fumarate is administered with the following: aluminum/magnesium hydroxide antacids, azithromycin, cetirizine, famotidine, fluconazole, and lorazepam. 7.7 Drugs Inhibiting Organic Cation Transporters 3TC, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, is predominantly eliminated in the urine by active organic cationic secretion. The possibility of interactions with other drugs administered concurrently should be considered, particularly when their main route of elimination is active renal secretion via the organic cationic transport system (e.g., trimethoprim) [see Clinical Pharmacology (12.3)]. No data are available regarding interactions with other drugs that have renal clearance mechanisms similar to that of 3TC.

Coadministration of single doses of 3TC and sorbitol resulted in a sorbitol dose-dependent reduction in 3TC exposures. When possible, avoid use of sorbitol-containing medicines with 3TC [see Clinical Pharmacology (12.3)]. 8 USE IN SPECIFIC POPULATIONS lamivudine and tenofovir disoproxil fumarate during pregnancy. Healthcare providers are encouraged to register patients by calling the

Although a causal relationship has not been established between exposure to EFV in the first trimester and neural tube defects, simila malformations have been observed in studies conducted in monkeys at doses similar to the human dose. In addition, fetal and embryonic toxicities ccurred in rats, at a dose ten times less than the human exposure at recommended clinical dose. Because of the potential risk of neural tube

defects, EFV should not be used in the first trimester of pregnancy. Advise pregnant women of the potential risk to a fetus. Prospective pregnancy data from the APR are not sufficient to adequately assess this risk of birth defects or miscarriage. FEV and 3TC have been ted in a limited number of women as reported to the APR. Available data from the APR show no difference in the risk of major birth defects for EFV and 3TC compared to the background rate for major birth defects of 2.7% in the U.S. reference population of the Metropolitan Atlanta Congenital Defects Program (MACDP). Available data from the APR also show no increase in the overall risk of major birth defects with first rimester exposure for TDF (2.1%) compared with the background rate for major birth defects of 2.7% in a U.S. reference population of the MACDP 3TC produced embryonic toxicity in rabbits at a dose that produced similar human exposures as the recommended clinical dose. The relevance of

animal findings to human pregnancy registry data is not known The rate of miscarriage is not reported in the APR. The estimated background rate of miscarriage in clinically recognized pregnancies in the U.S. general population is 15% to 20%. The background risk for major birth defects and miscarriage for the indicated population is unknown. The APR uses the MACDP as the U.S. reference population for birth defects in the general population. The MACDP evaluates women and infants from a imited geographic area and does not include outcomes for births that occurred at less than 20 weeks' gestation

Human Data: Efavirenz: There are retrospective postmarketing reports of findings consistent with neural tube defects, including meningomyelocele, all in infants of mothers exposed to EFV-containing regimens in the first trimester [see Warnings and Precautions (5.7)]  $Based \ on \ prospective \ reports \ from \ the \ APR \ of \ approximately \ 1,000 \ live \ births \ following \ exposure \ to \ EFV-containing \ regimens \ (including \ over \ 800) \ for \$ live births exposed in the first trimester), there was no difference between EFV and overall birth defects compared with the background birth defect  $rate of 2.7\% in the U.S.\ reference population of the Metropolitan Atlanta Congenital Defects Program. As of the interim APR report is sued December$ 2014, the prevalence of birth defects following first-trimester exposure was 2.3% (95% Cl: 1.4% to 3.6%). One of these prospectively reported defects with first-trimester exposure was a neural tube defect. A single case of anophthalmia with first-trimester exposure to EFV has also been prospectively reported. This case also included severe oblique facial clefts and amniotic banding, which have a known association with

Lamivudine: Based on prospective reports from the APR of over 11,000 exposures to 3TC during pregnancy resulting in live births (including over 4,300 exposed in the first trimester), there was no difference between 3TC and overall risk of birth defects for 3TC compared with the background birth defect rate of 2.7% in the U.S. reference population of the MACDP. The prevalence of defects in live births was 3.1% (95% CI: 2.6% to 3.6%) ollowing first trimester exposure to 3TC-containing regimens and 2.8% (95% CI: 2.5% to 3.3%) following second/third trimester exposure to 3TC containing regimens.

3TC pharmacokinetics were studied in pregnant women during 2 clinical trials conducted in South Africa. The trials assessed pharmacokinetics in 6 women at 36 weeks' gestation using 150 mg 3TC twice daily with zidovudine, 10 women at 38 weeks' gestation using 150 mg 3TC twice daily with zidovudine, and 10 women at 38 weeks' gestation using 3TC 300 mg twice daily without other antiretrovirals. These trials were not designed or 3TC concentrations were generally similar in maternal, neonatal, and umbilical cord serum samples. In a subset of subjects, amniotic fluid specimens were collected following natural rupture of membranes and confirmed that lamivudine crosses the placenta in humans. Based on limited

data at delivery, median (range) amniotic fluid concentrations of 3TC were 3.9 (1.2 to 12.8)-fold greater compared with paired maternal serum concentration (n = 8). Fenofovir Disoproxil Fumarate: Based on prospective reports from the APR exposures to TDF-containing regimens during pregnancy resulting in live births (including 3,342 exposed in the first trimester and 1,475 exposed in the second/third trimester), there was no increase in overall major birth defects with TDF compared with the background birth defect rate of 2.7% in a U.S. reference population of the MACDP. The prevalence of major birth defects in live births was 2.3% (95% CI: 1.8% to 2.8%) with first trimester exposure to TDF-containing regimens, and 2.1% (95% CI: 1.4% to 3.0%) with the second/third trimester exposure to TDF-containing regimens.

Prospective reports from the APR of overall major birth defects in pregnancies exposed to TDF are compared with a U.S. background major birt defect rate. Methodological limitations of the APR include the use of MACDP as the external comparator group. Limitations of using an external comparator include differences in methodology and populations, as well as confounding due to the underlying disease. n published data from three controlled clinical trials, a total of 327 pregnant women with chronic HBV infection were administered tenofov disoproxil fumarate from 28 to 32 weeks gestation through 1 to 2 months postpartum and followed for up to 12 months after delivery. There were no new safety findings in pregnant women compared with the known safety profile of tenofovir disoproxil fumarate in HBV-infected adults. An ncreased risk of adverse pregnancy-related outcomes was not observed; 2 stillbirths were identified, and there was 1 major birth defect (talipes)

and 1 occurrence of multiple congenital abnormalities (not further specified) in tenofovir disoproxil fumarate-exposed infants. Infants were followed for up to 12 months after delivery; there were no clinically relevant drug-related safety findings in infants exposed to tenofovir disoproxil Animal Data: Efavirenz: Effects of EFV on embryo-fetal development have been studied in three nonclinical species (cynomolgus monkeys, rats, and rabbits). In monkeys, EFV 60 mg/kg/day was administered to pregnant females throughout pregnancy (gestation days 20 through 150). The maternal systemic drug exposures (AUC) were 1.3 times the exposure in humans at the recommended clinical dose (600 mg/day), with fetal imbilical venous drug concentrations approximately 0.7 times the maternal values. Three of 20 fetuses/infants had one or more malformations; here were no malformed fetuses or infants from placebo-treated mothers. The malformations that occurred in these three monkey fetus included an encephaly and unilateral anophthalmia in one fetus, microophthalmia in a second, and cleft palate in the third. There was no NOAEL (no bservable adverse effect level) established for this study because only one dosage was evaluated. In rats, EFV was administered either during organogenesis (gestation days 7 to 18) or from gestation day 7 through lactation day 21 at 50, 100, or 200 mg/kg/day. Administration of 200 mg/kg/day in rats was associated with increase in the incidence of early resorptions; and doses 100 mg/kg/day and greater were associated with early neonatal mortality. The AUC at the NOAEL (50 mg/kg/day) in this rat study was 0.1 times that in humans at the recommended clinical dose.

Drug concentrations in the milk on lactation day 10 were approximately 8 times higher than those in maternal plasma. In pregnant rabbits, EFV was neither embryo lethal nor teratogenic when administered at doses of 25, 50, and 75 mg/kg/day over the period of organogenesis (gestation days 6 hrough 18). The AUC at the NOAEL (75 mg/kg/day) in rabbits was 0.4 times that in humans at the recommended clinical dose amivudine: 3TC was administered orally to pregnant rats (at 90, 600, and 4,000 mg per kg per day) and rabbits (at 90, 300, and 1,000 mg per kg per day and at 15, 40, and 90 mg per kg per day) during organogenesis (on gestation Days 7 through 16 [rat] and 8 through 20 [rabbit]). No evidence of fetal malformations due to 3TC was observed in rats and rabbits at doses producing plasma concentrations (C<sub>max</sub>) approximately 35 times higher han human exposure at the recommended daily dose. Evidence of early embryolethality was seen in the rabbit at system exposures (AUC) similar

exposure at the recommended daily dose. Studies in pregnant rats showed that 3TC is transferred to the fetus through the placenta. In the fertility/pre- and postnatal development study in rats, 3TC was administered orally at doses of 180, 900, and 4,000 mg per kg per day (from prior to mating through postnatal Day 20). In the study, development of the offspring, including fertility and reproductive performance, was not affected by the offspring of the offspringmaternal administration of 3TC. Tenofovir Disoproxil Fumarate: TDF was administered orally to pregnant rats (at 0, 50, 150, or 450 mg/kg/day) and rabbits (at 0, 30, 100, or 300 mg/kg/day) through organogenesis (on gestation days 7 through 17, and 6 through 18, respectively). No significant toxicological effects were observed in embryo-fetal toxicity studies performed with TDF in rats at doses up to 14 times the human dose based on body surface area comparisons and in rabbits at doses up to 19 times the human dose based on body surface area comparisons. In a pre/postnatal development study in rats, TDF was administered orally through lactation at doses up to 600 mg/kg/day; no adverse effects were observed in the offspring at tenofovir

exposures of approximately 2.7 times higher than human exposures at the recom 8.2 Lactation **Risk Summary:** The Centers for Disease Control and Prevention recommend that HIV-1-infected mothers not breastfeed their infants to avoid risking postnatal transmission of HIV-1 infection. Efavirenz: EFV has been shown to pass into human breast milk. There is no information available on the effects of EFV on the breastfed infant, or the

effects of EFV on milk production. Lamivudine: 3TC is present in human milk. Samples of breast milk obtained from 20 mothers receiving 3TC monotherapy, 300 mg twice daily (2 times the dose in efavirenz, lamivudine and tenofovir disoproxil fumarate tablets), had measurable concentrations of 3TC. There is no information on the effects of 3TC on the breastfed infant, or the effects of 3TC on milk production. Tenofovir Disporoxil Fumarate: Based on published data, tenofovir has been shown to be present in human breast milk (see Data). It is not known if tenofovir affects milk production or has effects on the breastfed child. Because of the potential for (1) HIV transmission (in HIV-negative infants); (2) developing viral resistance (in HIV-positive infants); and (3) adversereactions in a breastfed infant similar to those seen in adults, instruct mothers not to breastfeed if they are receiving efavirenz, lamivudine and Data: Tenofovir Disoproxil Fumarate: In a study of 50 HIV-uninfected, breastfeeding women on a tenofovir-containing regimen initiated between 1 and 24 weeks postpartum (median 13 weeks), tenofovir was undetectable in the plasma of most infants after 7 days of treatment in mothers

8.3 Females and Males of Reproductive Potential Because of potential teratogenic effects, pregnancy should be avoided in women receiving efavirenz, lamivudine and tenofovir disoproxil fumarate [see Warnings and Precautions (5.7), Use in Specific Populations (8.1)]. Pregnancy Testing: Females of reproductive potential should undergo pregnancy testing before initiation of efavirenz, lamivudine and tenofovir disoproxil fumarate. Contraception: Females of reproductive potential should use effective contraception during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate and for 12 weeks after discontinuing efavirenz, lamivudine and tenofovir disoproxil fumarate due to the long half-life of EFV. Barrier contraception should always be used in combination with other methods of contraception. Hormonal methods that contain progesterone

There were no serious adverse events in mothers or infants.

may have decreased effectiveness [see Drug Interactions (7.5)]. The safety and effectiveness of efavirenz, lamiyudine and tenofovir disoproxil fumarate as a fixed-dose tablet in pediatric patients infected with HIV-1 and weighing at least 40 kg have been established based on clinical studies using the individual components (efavirenz, lamivudine, and tenofovir disoproxil fumarate). 8.5 Geriatric Use

determine whether they respond differently from younger subjects. In general, caution should be exercised in the administration of 3TC in elderly patients reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy. 8.6 Renal Impairment  $Efavirenz, lamivudine \ and \ tenofovir \ disoproxil \ fumarate \ is \ not \ recommended \ for \ patients \ with \ impaired \ renal \ function \ (i.e., \ creatinine \ clearance \ less \ les$ 

Clinical studies of edvirenz, lamivudine and tenofovir disoproxil fumarate did not include sufficient numbers of subjects aged 65 and over to

than 50 mL/min) or patients with end-stage renal disease (ESRD) requiring hemodialysis because it is a fixed-dose combination formulation that cannot be adjusted [see Dosage and Administration (2.3)]. 8.7 Hepatic Impairment Efavirenz, lamivudine and tenofovir disoproxil fumarate is not recommended for patients with moderate or severe hepatic impairment because there are insufficient data to determine whether dose adjustment is necessary. Patients with mild hepatic impairment may be treated with efavirenz.

idine and tenofovir disoproxil fumarate without any adjustment in dose [see Dosage and Administration (2.4), Warnings and Precautions (5.9) and Clinical Pharmacology (12.3)]. 10 OVERDOSAGE If overdose occurs, the patient must be monitored for evidence of toxicity, and standard supportive treatment applied as necessary. Etavirenz: Some patients accidentally taking 600 mg twice daily have reported increased nervous system symptoms. One patient experienced voluntary muscle contractions. Treatment of overdose with EFV should consist of general supportive measures, including monitoring of vital signs and observation of the patient's clinical status. Administration of activated charcoal may be used to aid removal of unabsorbed drug. There is no specific antidote for overdose with

 $efavirenz. \ Since\ efavirenz\ is\ highly\ protein\ bound,\ dialysis\ is\ unlikely\ to\ significantly\ remove\ the\ drug\ from\ blood.$ Lamivudine: There is no known specific treatment for overdose with 3TC. If overdose occurs, the patient should be monitored and standard supportive treatment applied as required because a negligible amount of 3TC was removed via (4-hour) hemodialysis, continuous ambulatory peritoneal dialysis, and automated peritoneal dialysis, it is not known if continuous hemodialysis would provide clinical benefit in a 3TC overdose Tenofovir Disoproxil Fumarate: Limited clinical experience at doses higher than the therapeutic dose of TDF 300 mg is available  $Tenofovir\ is\ efficiently\ removed\ by\ hemodialysis\ with\ an\ extraction\ coefficient\ of\ approximately\ 54\%.\ Following\ a\ single\ 300\ mg\ dose\ of\ tenofovir\ single\ 300\ mg\ dose\ single\ 300\ mg\ dose\ single\ 300\ mg\ dose\ single\ 300\ mg\ dose\$ disoproxil fumarate, a 4-hour hemodialysis session removed approximately 10% of the administered tenofovir dose.

Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets contain efavirenz (EFV), an HIV-1 specific, non-nucleoside, reverse transcriptase inhibitor (NNRTI), lamivudine (also known as 3TC), a synthetic nucleoside analogue with activity against HIV-1 and tenofovir disoproxil furmarate (TDF) (a prodrug of tenofovir), a furmaric acid salt of bis-isopropoxycarbonyloxymethyl ester derivative of tenofovir. TDF is converted *in vivo* to tenofovir, an acyclic nucleoside phosphonate (nucleotide) analog of adenosine 5'-monophosphate. Tenofovir exhibits activity against HIV-1 reverse transcriptase. Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are for oral administration. Each film coated tablet contains efavirenz USP 600 mg, lamivudine USP 300 mg and tenofovir disoproxil fumarate 300 mg equivalent to tenofovir disoproxil 245 mg, and the following inactive ingredients: croscarmellose sodium, hydroxypropyl cellulose, lactose anhydrous, magnesium stearate, microcrystalline cellulose, pregelatinized starch,

polyethylene glycol, polyvinyl alcohol, sodium lauryl sulfate, talc and titanium dioxide. Etavirenz: The chemical name of efavirenz is (S)-6-Chloro-4-(cyclopropylethynyl)-1,4-dihydro-4-(trifluoromethyl)-2H-3,1-benzoxazin-2-one. Its molecular formula is  $C_{ii}H_{ij}CIF_{ij}NO_{ij}$  and its structural formula is:

Efavirenz USP is a white to off white powder with a molecular mass of 315.67. It is soluble in methanol and practically insoluble in water (< 10

 $\textbf{Lamivudine:} \ \ \text{The } \ \ \text{chemical name of lamivudine is } \ \ (\cdot)-1-[(2R,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl] cytosine. \ \ \ \ \text{Lamivudine is the } \ \ (\cdot)\text{enantiomer of a dideoxy analogue of cytidine. The effect of food on efavirenz, lamivudine and tenofovir disoproxil fumarate has not been evaluated. Efavirenz: In HIV-1-infected subjects, time-to-peak plasma concentrations were approximately 3 to 5 hours and steady-state plasma concentrations were reached in 6 to 10 days. EFV is highly bound (approximately 99.5 to 99.75%) to human plasma proteins, predominantly albumin. Following administration of "C-labeled EFV, 14 to 34% of the dose was recovered in the urine (mostly as metabolites) and 16 to 61% was recovered in feces (mostly as parent drug). In vitro studies suggest CYP3A and CYP2B6 are the major isozymes responsible for EFV metabolism.  $EFV\ has\ been\ shown\ to\ induce\ CYP\ enzymes,\ resulting\ in\ induction\ of\ its\ own\ metabolism.\ EFV\ has\ a\ terminal\ half-life\ of\ 52\ to\ 76\ hours\ after\ single\ and\ the single\ of\ 52\ to\ 76\ hours\ after\ single\ of\ 52\ hours\ after\$ doses and 40 to 55 hours after multiple doses.

 $\textbf{\textit{Lamivudine:}} \ \text{After oral administration of 2 mg/kg of 3TC twice a day to 9 adults with HIV-1, the peak serum 3TC concentration ($C_{max}$) was 1.5 \pm 0.5$}$ mcg/mL (mean  $\pm$  SD). The area under the plasma concentration versus time curve (AUC) and  $C_{\rm main}$  increased in proportion to oral dose over the range from 0.25 to 10 mg/kg and absolute bioavailability in 12 adult patients was 86%  $\pm$  16% (mean  $\pm$  SD) for the 150-mg tablet and 87%  $\pm$  13% for the oral solution. Binding of 3TC to human plasma proteins is low (< 36%). Within 12 hours after a single oral dose of 3TC in 6 HIV-1-infected adults,  $5.2\% \pm 1.4\%$  (mean  $\pm$  SD) of the dose was excreted as the trans-sulfoxide metabolite in the urine. The majority of 3TC is eliminated unchanged in urine by active organic cationic secretion and the observed mean elimination half-life (t.a) ranged from 5 to 7 hours in most single-dose studies with Tenofovir Disoproxil Fumarate: Following oral administration of a single 300 mg dose of TDF to HIV-1-infected subjects in the fasted state, maximum serum concentrations (C, w) were achieved in 1.0 ± 0.4 hrs (mean ± SD) and C, and AUC values were 296 ± 90 ng/mL and 2,287 ± 685  $ng \bullet hr/mL$ , respectively. The oral bioavailability of tenofovir from TDF in fasted subjects is approximately 25%. Less than 0.7% of tenofovir binds to human plasma proteins in vitro and the binding is independent of concentration over the range of 0.01 to 25 mcg/mL. Approximately 70 to 80% of

the intravenous dose of tenofovir is recovered as unchanged drug in the urine. Tenofovir is eliminated by a combination of glomerular filtration and active tubular secretion with a renal clearance in adults with normal renal function of 243 ± 33 mL/min (mean ± SD). Following a single oral dose, the terminal elimination half-life of tenofovir is approximately 17 hours. Special Populations

<u>Efavirenz and Lamivudine:</u> There are no significant or clinically relevant racial differences in EFV and 3TC pharmacokinetics. Tenofovir Disoproxil Fumarate: There were insufficient numbers from racial and ethnic groups other than Caucasian to adequately determine potential pharmacokinetic differences among these populations. Gender: There are no significant or clinically relevant gender differences in the pharmacokinetics of EFV, 3TC, and TDF. Geriatric Patients: The pharmacokinetics of 3TC and TDF have not been studied in patients over 65 years of age.

Patients with Renal Impairment: [See Use in Specific Populations (8.6).]
<u>Etavirenz</u>: The pharmacokinetics of EFV have not been studied in patients with renal impairmer Lamivudine: The pharmacokinetics of 3TC are altered in subjects with renal impairment (Table 4). Table 4 Pharmacokinetic Parameters (Mean + SD) after a Single 300-mg Oral Dose of 3TC in Subjects with Varying Dagraes of Penal Expedie

CL/F (mL/min)	1043.7 ± 115.4	807.7 ± 279.2	444.4 ± 209.8	177.0 ± 97.1
CL <sub>renal</sub> (mL/min)	243.5 ± 33.3	168.6 ± 27.5	100.6 ± 27.5	43.0 ± 31.2

Efavirenz: A multiple-dose study showed no significant effect on EFV pharmacokinetics in patients with mild hepatic impairment (Child-Pugh Class A) compared with controls. There were insufficient data to determine whether moderate or severe hepatic impairment (Child-Pugh Class B or C) affects EFV pharmacokinetics <u>Lamivudine:</u> The pharmacokinetic properties of 3TC have been determined in adults with impaired hepatic function. Pharmacokinetic parameter were not altered by diminishing hepatic function. Safety and efficacy of 3TC have not been established in the presence of decompensated liver

Tenofovir Disoproxil Fumarate: The pharmacokinetics of tenofovir following a 300 mg single dose of TDF have been studied in non-HIV infected subjects with moderate to severe (Child-Pugh B to C) hepatic impairment. There were no substantial alterations in tenofovir pharmacokinetics in Assessment of Drug Interactions: [See Drug Interactions (7).] Efavirenz: EFV has been shown in vivo to cause hepatic enzyme induction, thus increasing the biotransformation of some drugs metabolized by

CYP3A and CYP2B6. In vitro studies have shown that EFV inhibited CYP isozymes 2C9, 2C19, and 3A4 with K.values (8.5 to 17 mcM) in the range of observed EFV plasma concentrations. In in vitro studies, EFV did not inhibit CYP2E1 and inhibited CYP2D6 and CYP1A2 (K, values 82 to 160 mcM) only at concentrations well above those achieved clinically. Coadministration of FFV with druos primarily metabolized by 2C9, 2C19, and 3A isozymes may result in altered plasma concentrations of the coadministered drug. Drugs which induce CYP3A activity would be expected to increase the clearance of EFV resulting in lowered plasma concentrations. Drug interaction studies were performed with EFV and other drugs likely to be coadministered or drugs commonly used as probes for

Relative to steady-state administration of efavirenz (600 mg once daily for 9 days)

Lamivudine: Effect of 3TC on the Pharmacokinetics of Other Agents: Based on in vitro study results, 3TC at therapeutic drug exposures is not expected to affect the pharmacokinetics of drugs that are substrates of the following transporters: organic anion transporter polypeptide 1B1/3 (OATP1B1/3), breast cancer resistance protein (BCRP), P-glycoprotein (P-gp), multidrug and toxin extrusion protein 1 (MATE1), MATE2-K, organic cation transporter 1 (OCT1), OCT2, or OCT3. Effect of Other Agents on the Pharmacokinetics of 3TC: 3TC is a substrate of MATE1, MATE2-K, and OCT2 in vitro. Trimethoprim (an inhibitor of

these drug transporters) has been shown to increase 3TC plasma concentrations. This interaction is not considered clinically significant as no dose adjustment of 3TC is needed. 3TC is a substrate of P-gp and BCRP; however, considering its absolute bioavailability (87%), it is unlikely that these transporters play a significant role in the absorption of 3TC. Therefore, coadministration of drugs that are inhibitors of these efflux transporters is unlikely to affect the disposition

and elimination of 3TC. Interferon Alfa: There was no significant pharmacokinetic interaction between 3TC and interferon alfa in a trial of 19 healthy male subjects Ribayirin: In vitro data indicate ribayirin reduces phosphorylation of 3TC, stayudine, and zidovudine. However, no pharmacokinetic (e.g., plasma concentrations or intracellular triphosphorylated active metabolite concentrations) or pharmacodynamic (e.g., loss of HIV-1/HCV virologic suppression) interaction was observed when ribavirin and 3TC (n = 18), stavudine (n = 10), or zidovudine (n = 6) were coadministered as part of a nulti-drug regimen to HIV-1/HCV co-infected subjects. Sorbitol (Excipient): 3TC and sorbitol solutions were coadministered to 16 healthy adult subjects in an open-label, randomized-sequence, 4-period, crossover trial. Each subject received a single 300-mg dose of 3TC oral solution alone or coadministered with a single dose of 3.2 grams, 10.2

grams, or 13.4 grams of sorbitol in solution. Coadministration of 3TC with sorbitol resulted in dose-dependent decreases of 20%, 39%, and 44% in the  $AUC_{low}$ , and 36% in the  $AUC_{low}$ , and 28%, 52%, and 55% in the  $C_{low}$  of lamivudine, respectively. Irimethoprim/Sulfamethoxazole: 3TC and TMP/SMX were coadministered to 14 HIV-1-positive subjects in a single-center, open-label, randomized, crossover trial. Each subject received treatment with a single 300-mg dose of 3TC and TMP 160 mg/SMX 800 mg once a day for 5 days with concomitant administration of 3TC 300 mg with the fifth dose in a crossover design. Coadministration of TMP/SMX with 3TC resulted in an increase of  $43\% \pm 23\%$  (mean  $\pm$  SD) in 3TC AUC., a decrease of  $29\% \pm 13\%$  in 3TC oral clearance, and a decrease of  $30\% \pm 36\%$  in 3TC renal clearance. The pharmacokinetic properties of TMP and SMX were not altered by coadministration with 3TC. There is no information regarding the  $effect on 3TC\ pharmacokinetics\ of\ higher\ doses\ of\ TMP/SMX\ such\ as\ those\ used\ in\ treating\ PCP.$ Tenofovir Disoproxil Fumarate: At concentrations substantially higher (~300-fold) than those observed in vivo, tenofovir did not inhibit in vitro CYP3A4, CYP2D6, CYP2C9, or CYP2E1. However, a small (6%) but statistically significant reduction in metabolism of CYP1A substrate was

 $observed. \ Based on the results of {\it in vitro} \ experiments and the known elimination pathway of tenofovir, the potential for CYP-mediated interactions$ involving TDF with other medicinal products is low.  $Table\ 8\ summarizes\ pharmacokinetic\ effects\ of\ coadministered\ drug\ on\ tenofovir\ pharmacokinetics.\ No\ clinically\ significant\ drug\ interactions\ have$ been observed between tenofovir and ribavirin.

<sup>a</sup> Subjects received tenofovir disoproxil fumarate 300 mg once daily. Increase = ↑: Decrease = ⊥: No Effect = ↔: NC = Not Calculated

of mammalian DNA polymerases  $\alpha,\beta,$  and mitochondrial DNA polymerase  $\gamma.$ 

Study conducted with efavirenz/emtricitabine/tenofovir disoproxil fumarate coadministered with ledipasvir/sofosbuvir <sup>d</sup>Study conducted with efavirenz/emtricitabine/tenofovir disoproxil fumarate coadministered with sofosbuvir. Data generated from simultaneous dosing with ledipasvir/sofosbuvir. Staggered administration (12 hours apart) provide similar results. Comparison based on exposures when administered as atazanavir/ritonavir + emtricitabine/tenofovir DF

\*Comparison based on exposures when administered as darunawir/ritonavir + emtricitabine/tenofovir DF.

\*Study conducted with COMPLERA coadministered with EPCLUSA; coadministration with EPCLUSA also results in comparable increases in tenofovir exposures when TDF is administered as ATRIPLA, STRIBILD® (elvitegravir/cobicistat/FTC/TDF), TRUVADA + atazanavir/ritonavir, or TRUVADA + darunavir/ritonavi Administered as raltegravir + FTC/TDF. Comparison based on exposures when administered as darunavir + ritonavir + FTC/TDF.

\*Study conducted with additional voxilaprevir 100 mg to achieve voxilaprevir exposures expected in HCV-infected patients.

Mechanism of Action: Efavirenz: EFV is an NNRTI of HIV-1. EFV activity is mediated predominantly by noncompetitive inhibition of HIV-1 reverse transcriptase (RT). HIV-2 RT and human cellular DNA polymerases  $\alpha$ ,  $\beta$ ,  $\gamma$ , and  $\delta$  are not inhibited by EFV. Lamivudine: 3TC is a synthetic nucleoside analogue with activity against HIV-1 and HBV. Intracellularly, 3TC is phosphorylated to its active 5'triphosphate metabolite, lamivudine triphosphate (3TC-TP). The principal mode of action of 3TC-TP is inhibition of HIV-1 reverse transcriptase (RT) via DNA chain termination after incorporation of the nucleotide analogue. Tenofovir Disoproxil Fumarate: TDF is an acyclic nucleoside phosphonate diester analog of adenosine monophosphate. TDF requires initial diester hydrolysis for conversion to tenofovir and subsequent phosphorylations by cellular enzymes to form tenofovir diphosphate (TDF-DP), an obligate chain terminator. Tenofovir diphosphate inhibits the activity of HIV-1 reverse transcriptase (RT) and HBV RT by competing with the natural substrate deoxyadenosine 5'-triphosphate and, after incorporation into DNA, by DNA chain termination. Tenofovir diphosphate is a weak inhibitor

culture by 90 to 95% (EC $_{\infty}$   $_{\infty}$ ) ranged from 1.7 to 25 nM in lymphoblastoid cell lines, peripheral blood mononuclear cells (PBMCs), and macrophage/monocyte cultures. EFV demonstrated antiviral activity against clade B and most non-clade B isolates (subtypes A, AE, AG, C, D, F, G, J, N), but had reduced antiviral activity against group O viruses. Lamivudine: The antiviral activity of 3TC against HIV-1 was assessed in a number of cell lines (including monocytes and fresh human peripheral blood lymphocytes (PBMCs) using standard susceptibility assays. EC<sub>so</sub> values were in the range of 3 to 15,000 nM. (1 mcM = 0.23 mcg/mL). The median EC<sub>so</sub> values of 3TC were 60 nM (range: 20 to 70 nM), 35 nM (range: 30 to 40 nM), 30 nM (range: 20 to 90 nM), 20 nM (range: 3 to 40 nM), 30 nM (range: 20 to 90 nM), 20 nM (range: 30 to 40 nM), 30 nM (range: 20 to 90 nM), 20 nM (range: 30 to 40 nM), 30 nM (range: 30 to 4 milk (ange: 1 to 60 mM), 30 mM (range: 20 to 70 mM), 30 mM (range: 30 to 70 mM), and 30 mM (range: 20 to 90 mM), against HIV-1 clades A to G and group O viruses (n = 3 except n = 2 for clade B), respectively. The EC<sub>ss</sub> values against HIV-2 isolates (n = 4) ranged from 3 to 120 mM in PBMCs. 3TC vas not antagonistic to all tested anti-HIV agents. Ribavirin (50 mcM) used in the treatment of chronic HCV infection decreased the anti-HIV-1

Antiviral Activity: Efavirenz: The concentration of EFV inhibiting replication of wild-type laboratory adapted strains and clinical isolates in cell

activity of 3TC by 3.5-fold in MT-4 cells. Tenofovir Disoproxil Fumarate: The antiviral activity of tenofovir against laboratory and clinical isolates of HIV-1 was assessed in lymphoblastoic cell lines, primary monocyte/macrophage cells and peripheral blood lymphocytes. The EC<sub>ss</sub>(50% effective concentration) values for tenofovir were in the range of 0.04 mcM to 8.5 mcM. Tenofovir displayed antiviral activity in cell culture against HIV-1 clades A, B, C, D, E, F, G, and O (EC<sub>ss</sub>values ranged from 0.5 mcM to 2.2 mcM) and strain-specific activity against HIV-2 (EC<sub>so</sub> values ranged from 1.6 mcM to 5.5 mcM). Please see the full prescribing information for VIREAD® for information regarding the inhibitory activity of TDF against HBV. Resistance: Efavirenz: In cell culture, HIV-1 isolates with reduced susceptibility to EFV (> 380-fold increase in EC<sub>so</sub> value) emerged rapidly in the

presence of drug. Genotypic characterization of these viruses identified single amino acid substitutions L100I or V179D, double substitutions L100I/V108I, and triple substitutions L100I/V179D/V181C in reverse transcriptase. Clinical isolates with reduced susceptibility in cell culture to EFV have been obtained. One or more RT substitutions at amino acid positions A98, L100, K101, K103, V106, V108, Y188, G190, P225, F227 and M230 were observed in patients failing treatment with EFV in combination with indinavir, or with 3TC plus zidovudine. The K103N substitution was the most frequently observed. Lamivudine: 3TC-resistant variants of HIV-1 have been selected in cell culture. Genotypic analysis showed that resistance was predominantly due

to a methionine to valine or isoleucine (M184V/I) substitution in reverse transcriptase. Tenofovir Disoproxil Fumarate: HIV-1 isolates with reduced susceptibility to tenofovir have been selected in cell culture. These viruses expressed a 65R substitution in RT and showed a 2- to 4-fold reduction in susceptibility to tenofovir. In addition, a K70E sub-

also phenotypically resistant in cell culture to delavirdine and nevirapine compared to baseline. Delavirdine- and/or nevirapine- resistant clinical viral isolates with NNRTI resistance-associated substitutions (A98G, L100I, K101E/P, K103N/S, V106A, Y181X, Y188X, G190X, P225H, F227L, or M230L) showed reduced susceptibility to EFV in cell culture. Greater than 90% of NRTI-resistant clinical isolates tested in cell culture retained

Lamivudine: Cross-resistance among NRTIs has been observed. 3TC-resistant HIV-1 isolates were cross-resistant in cell culture to didanosine (ddl). Cross-resistance is also expected with abacavir and emtricitabine as these select M184V substitutions

Tenofovir Disoproxil Fumarate: Cross-resistance among certain HIV-1 NRTIs has been observed. The K65R and K70E substitutions selected by enofovir are also selected in some HIV-1-infected subjects treated with abacavir or didanosine. HIV-1 isolates with the K65R substitution also showed reduced susceptibility to FTC and 3TC. HIV-1 isolates from subjects (N = 20) whose HIV-1 expressed a mean of 3 zidovudine-associated RT mino acid substitutions (M41L, D67N, K70R, L210W, T215Y/F, or K2190/E/N) showed a 3.1-fold decrease in the susceptibility to tenofovi Subjects whose virus expressed an L74V substitution without zidovudine resistance-associated substitutions (N = 8) had reduced response to /IREAD. Limited data are available for patients whose virus expressed a Y115F substitution (N = 3), Q151M substitution (N = 2), or T69 insertion (N = 4), all of whom had a reduced response.

13 NONCLINICAL TOXICOLOGY  ${\bf 13.1\ Carcinogenesis}, {\bf Mutagenesis}, {\bf Impairment}\, {\bf of}\, {\bf Fertility}$ 

Elavirenz: Long-term carcinogenicity studies in mice and rats were carried out with efavirenz. Mice were dosed with 0, 25, 75, 150, or 300 mg/kg/day for 2 years. Incidences of hepatocellular adenomas and carcinomas and pulmonary alveolar/bronchiolar adenomas were increased above background in females. No increases in tumor incidence above background were seen in males. There was no NOAEL in female established for this study because tumor findings occurred at all doses. AUC at the NOAEL (150 mg/kg) in the males was approximately 0.9 times that in mans at the recommended clinical dose. In the rat study, no increases in tumor incidence were observed at doses up to 100 mg/kg/day, for which AUCs were 0.1 (males) or 0.2 (females) times those in humans at the recommended clinical dose.

FFV tested negative in a battery of in vitro and in vivo genotoxicity assays. These included bacterial mutation assays in S. typhimurium and F. coli mammalian mutation assays in Chinese hamster ovary cells, chromosome aberration assays in human peripheral blood lymphocytes or Chinese hamster ovary cells, and an in vivo mouse bone marrow micronucleus assay. FFV did not impair mating or fertility of male or female rats, and did not affect sperm of treated male rats. The reproductive performance of offspring orn to female rats given EFV was not affected. The AUCs at the NOAEL values in male (200 mg/kg) and female (100 mg/kg) rats were approximately

≤ 0.15 times that in humans at the recommended clinical dose. Lamivudine: Long-term carcinogenicity studies with 3TC in mice and rats showed no evidence of carcinogenic potential at exposures up to 10 times (mice) and 58 times (rats) the human exposures at the recommended dose of 300 mg. 3TC was not mutagenic in a microbial mutagenicity assay, in a rat micronucleus test, in a rat bone marrow cytogenetic assay, and in assay for unscheduled DNA synthesis in rat liver. 3TC showed no evidence of *in vivo* genotoxic activity in the rat at oral doses of up to 2,000 mg per kg, producing plasma levels of 35 to 45 times those in humans at the recommended dose for HIV-1 infection. In a study of reproductive performance, 3TC administered to rats at doses up to 4,000 mg per kg per day, producing plasma levels 47 to 70 times those in humans, revealed no evidence of impaired fertility and no

effect on the survival, growth, and development to weaning of the offspring. Tenofovir Disoproxil Fumarate: Long-term oral carcinogenicity studies of TDF in mice and rats were carried out at exposures up to approximately 16 times (mice) and 5 times (rats) those observed in humans at the therapeutic dose for HIV-1 infection. At the high dose in female mice, liver adenomas were increased at exposures 16 times that in humans. In rats, the study was negative for carcinogenic findings at exposures up to 5 times that observed in humans at the therapeutic dose.

TDF was mutagenic in the in vitro mouse lymphoma assay and negative in an in vitro bacterial mutagenicity test (Ames test). In an in vivo mouse micronucleus assay, TDF was negative when administered to male mice. There were no effects on fertility, mating performance or early embryonic development when TDF was administered to male rats at a dose

equivalent to 10 times the human dose based on body surface area comparisons for 28 days prior to mating and to female rats for 15 days prior to mating through day seven of gestation. There was, however, an alteration of the estrous cycle in female rats 13.2 Animal Toxicology and/or Pharmacology
Elavirenz: Nonsustained convulsions were observed in 6 of 20 monkeys receiving EFV at doses yielding plasma AUC values 4- to 13-fold greater than those in humans given the recommended dose [see Warnings and Precautions (5.11)]. Tenofovir Disoproxil Fumarate: Tenofovir and TDF administered in toxicology studies to rats, dogs, and monkeys at exposures (based on AUCs) greater than or equal to 6-fold those observed in humans caused bone toxicity. In monkeys the bone toxicity was diagnosed as osteom

Osteomalacia observed in monkeys appeared to be reversible upon dose reduction or discontinuation of tenofovir. In rats and dogs, the bone toxicity manifested as reduced bone mineral density. The mechanism(s) underlying bone toxicity is unknown. Evidence of renal toxicity was noted in 4 animal species. Increases in serum creatinine, BUN, glycosuria, proteinuria, phosphaturia, and/or calciuria and decreases in serum phosphate were observed to varying degrees in these animals. These toxicities were noted at exposures (based on AUCs) 2 to 20 times higher than those observed in humans. The relationship of the renal abnormalities, particularly the phosphaturia, to the bone toxicity is

14 CLINICAL STUDIES

9 provides treatment outcomes through 48 and 144 weeks

14.1 Clinical Efficacy in Patients with HIV-1 Infection Treatment-Naïve Adult Patients: The efficacy of EFV 600 mg, 3TC 300 mg, and TDF 300 mg in the treatment of HIV-1 infection in adults with no antiretroviral treatment history was established in Trial 903. Trial 903: Data through 144 weeks are reported for Trial 903, a double-blind, active-controlled multicenter trial comparing FFV 600 mg + 3TC 300 may 500. Data intologin 144 weeks are reported for may 500, a docuber milk, active controlled infinite interior may 107 300 mg vs. EFV 600 mg + 3TC 300 mg + stavudine (d4T) 40 mg in 600 antiretroviral-naïve subjects. Subjects had a mean age of 36 years (range 18 to 64); 74% were male, 64% were Caucasian, and 20% were Black. The mean baseline CD4+ cell count was 279 cells/mm³ (range 3 to 956) and median baseline plasma HIV-1 RNA was 77,600 copies/mL (range 417 to 5,130,000). Subjects were stratified by baseline HIV-1 RNA and CD4+ cell count. Forty-three percent of subjects had baseline viral loads > 100,000 copies/mL and 39% had CD4+ cell counts < 200 cells/mm3. Table

Outcomes	At We	eek 48	At Week 144		
	EFV + 3TC + TDF (N = 299)	EFV + 3TC + d4T (N = 301)	EFV + 3TC + TDF (N = 299)	EFV + 3TC + d4T (N = 301)

 $Subjects\ achieved\ and\ maintained\ confirmed\ HIV-1\ RNA<400\ copies/mL\ through\ Week\ 48\ and\ 144.$ Includes confirmed viral rebound and failure to achieve confirmed < 400 copies/mL through Week 48 and 144.

Includes lost to follow-up, subject's withdrawal, noncompliance, protocol violation and other reason Achievement of plasma HIV-1 RNA concentrations of < 400 copies/mL at Week 144 was similar between the two treatment groups for the population stratified at baseline on the basis of HIV-1 RNA concentration (> or ≤ 100,000 copies/mL) and CD4+ cell count (< or ≥ 200 cells/mm³). Through 144 weeks of therapy, 62% and 58% of subjects in the TDF and 4dT arms, respectively, achieved and maintained confirmed HIV-1 RNA < 50 copies/mL. The mean increase from baseline in CD4+ cell count was 263 cells/mm³for the TDF arm and 283 cells/mm³for the 4dT arm. Through 144 weeks, 11 subjects in the TDF group and 9 subjects in the 4dT group experienced a new CDC Class C event.

16 HOW SUPPLIED/STORAGE AND HANDLING Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets 600 mg/300 mg/300 mg are white colored, capsule shaped, biconvex, film coated tablets, debossed with 'L65' on one side and plain on the other side. They are available as follows Bottles of 30 NDC 42385-928-30

Bottles of 90 Store at 20° to 25°C (68° to 77°F), excursions permitted between 15° to 30°C (59° to 86°F). [See USP Controlled Room Temperature.] Keep the bottle tightly closed.

Dispense in original container Do not use if seal over bottle opening is broken or missing. 17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Patient Information). Drug Interactions: Efavirenz, lamivudine and tenofovir disoproxil fumarate may interact with many drugs; therefore, advise patients to report to neir healthcare provider the use of any other prescription, nonprescription medication, or herbal products, particularly St. John's wort [see Contraindications (4) and Drug Interactions (7)].

Post Treatment Acute Exacerbation of Hepatitis B in Patients with HBV Co-Infection: Inform patients that severe acute exacerbations of hepatitis have been reported in patients who are infected with HBV or coinfected with HBV and HIV-1 and have discontinued 3TC and TDF, components of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Test patients with HIV-1 for hepatitis B virus (HBV) before initiating antiretroviral therapy. In patients with chronic hepatitis B, it is important to obtain HIV antibody testing prior to initiating 3TC and TDF, components of efavirenz, udine and tenofovir disoproxil fumarate tablets [see Warnings and Precautions (5.1)].

Lactic Acidosis and Severe Hepatomegaly: Inform patients that lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported. Treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate should be suspended in any patient who develops clinical symptoms suggestive of lactic acidosis or pronounced hepatotoxicity (including nausea, vomiting, unusual or unexpected stomach discomfort, and weakness) [see Warnings and Precautions (5.2)].

New Onset or Worsening Renal Impairment: Inform patients that renal impairment, including cases of acute renal failure and Fanconi syndrome, nas been reported. Advise patients with impaired renal function (i.e., creatinine clearance less than 50 mL/min) or patients with end-stage renal disease (ESRD) requiring hemodialysis to avoid efavirenz, lamivudine and tenofovir disoproxil fumarate with concurrent or recent use of a nephrotoxic agent (e.g., high-dose or multiple NSAIDs) for patients [see Dosage and Administration (2.3), Warnings and Precautions (5.4)]. Psychiatric Symptoms: Inform patients that serious psychiatric symptoms including severe depression, suicide attempts, aggressive behav delusions, paranoia, psychosis-like symptoms and catatonia have been reported in patients receiving EFV [see Warnings and Precautions (5.5)]. Advise patients to seek immediate medical evaluation if they experience severe psychiatric adverse experiences. Advise patients to inform their

physician of any history of mental illness or substance abuse. Nervous System Symptoms: Inform patients that central nervous system symptoms (NSS) including dizziness, insomnia, impaired concentration drowsiness, and abnormal dreams are commonly reported during the first weeks of therapy with EFV, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets [see Warnings and Precautions (5.6)]. Dosing at bedtime may improve the tolerability of these symptoms, which are likely to improve with continued therapy. Alert patients to the potential for additive effects when used concomitantly with alcohol or psychoactive drugs. Instruct patients that if they experience NSS they should avoid potentially hazardous tasks such as driving or operating

Inform patients that there is a risk of developing late-onset neurotoxicity, including ataxia and encephalopathy, which may occur months to years after beginning efavirenz therapy [see Warnings and Precautions (5.6)]. Embryo-Fetal Toxicity: Advise female patients that EFV, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets may cause fetal harm when administered during the first trimester to a pregnant woman. Advise females of reproductive potential to use effective contraception as well as a barrier method during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate and for 12 weeks after discontinuation of use. Advise patients to contact their healthcare provider if they plan to become pregnant, become pregnant, or if pregnancy is suspected during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate [see Warnings and Precautions (5.7), Use in Specific Populations (8.1, 8.3)1.

Rash: Inform patients that rash is a common side effect of EFV [see Warnings and Precautions (5.8)]. Rashes usually go away without any change

in treatment. However, since rash may be serious, patients should be advised to contact their physician promptly if rash occur Hepatotoxicity: Inform patients to watch for early warning signs of liver inflammation or failure, such as fatigue, weakness, lack of appetite, nausea and vomiting, as well as later signs such as jaundice, confusion, abdominal swelling, and discolored feces and to consult their healthcare provider promptly if such symptoms occur [see Warnings and Precautions (5.9)]. Pancreatitis: Advise patients or guardians to monitor pediatric patients for signs and symptoms of pancreatitis [see Warnings and Precautions Convulsions: Advise patients that convulsions have been observed in patients receiving EFV, a component of efavirenz, lamivudine and tenofovir

disoproxil fumarate tablets, generally in patients with known medical history of seizures [see Warnings and Precautions (5.11)]. Lipid Elevations: Advise patients treatment with EFV, a component of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets has resulted in increases in the concentration of total cholesterol and triglycerides [see Warnings and Precautions (5.12)]. Bone Loss and Mineralization Effects: Inform patients that decreases in bone mineral density have been observed with the use of 3TC and TDF, mponents of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, in patients with HIV [see Warnings and Precautions (5.13)]. Immune Reconstitution Syndrome: Advise patients to inform their healthcare provider immediately of any symptoms of infection, as in some patients with advanced HIV infection, signs and symptoms of inflammation from previous infections may occur soon after anti-HIV treatment is

started [see Warnings and Precautions (5.14)]. Fat Redistribution: Inform patients that redistribution or accumulation of body fat may occur in patients receiving antiretroviral therapy, including efavirenz, lamivudine and tenofovir disoproxil fumarate, and that the cause and long-term health effects of these conditions are not known at this time [see Warnings and Precautions (5.15)]. Administration Instructions: Inform patients that it is important to take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets once daily on a regular dosing schedule on an empty stomach, preferably at bedtime, and to avoid missing doses as it can result in development of resistance.

Advise patients if a dose is missed, take it as soon as possible unless it is almost time for the next dose. Also advise patients that dosing at bedtime may improve the tolerability of nervous system symptoms [see Dosage and Administration (2.2)]. Pregnancy Registry: Advise patients that there is an antiretroviral pregnancy registry to monitor fetal outcomes in women exposed to efavirenz, lamivudine and tenofovir disoproxil fumarate Isee Use in Specific Populations (8.1) Lactation: Instruct women with HIV-1 infection not to breastfeed because HIV-1 can be passed to the baby in breast milk [see Use in Specific

hat is the most important information I should know about efavirenz, lamivudine and tenofovir disoproxil fumarate tablets?	
avirenz, lamivudine and tenofovir disoproxil fumarate tablets can cause serious side effects, including:	

your HBV may get worse (flare-up) if you stop taking efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. A "flare-up" is when your HBV infection suddenly returns in a worse way than before. Your healthcare provider will test you for HBV infection before you start treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. It is not known if efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are safe and effective in people who have both HIVand HBV infection

Worsening of Hepatitis B virus infection. If you have Human Immunodeficiency Virus type 1 (HIV-1) and Hepatitis B Virus (HBV) infection

Do not run out of efavirer

Do not stop efavirenz, lamivudine and tenofovir disoproxil fumarate tablets without first talking to your healthcare provider. health often and do blood tests regularly for several months to check your liver.

What are efavirenz, lamivudine and tenofovir disoproxil fumarate tablets? Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are a prescription medicine that is used without other antiretroviral medicine to treat Human Immunodeficiency Virus-1 (HIV-1) in adults and children weighing at least 88 pounds (40 kg). HIV-1 is the virus that causes AIDS (Acquired Immune Deficiency Syndrome).

Efavirenz, lamivudine and tenofovir disoproxil furnarate tablets contains the prescription medicines efavirenz, lamivudine and tenofovi disoproxil fumarate. Do not take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets if you:

are all ergic to efavirenz, lamivudine, tenofovir disoproxil fumarate, or any of the ingredients in efavirenz, lamivudine and tenofovir disoproxil fumarate.fumarate tablets. See the end of this Patient Information leaflet for a complete list of ingredients in efavirenz, lamivudine and tenofovi

are currently taking elbasyir and grazoprevir. Before you take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, tell your healthcare provider about all of your medical

conditions, including if you: have liver problems, including hepatitis B or C infection have kidney problems, including end-stage renal disease (ESRD) that requires dialysis

have a history of mental health problems

have a history of drug or alcohol abuse have a heart problem, including QT prolongation have bone problems, including a history of bone fractures  $\,$ have a history of seizures

are pregnant or plan to become pregnant. Efavirenz, lamivudine and tenofovir disoproxil fumarate tablets may harm your unborn baby. You should not become pregnant during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Tell your healthcare provider right away if you think you may be pregnant or become pregnant during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets.

Females who are able to become pregnant should use effective birth control during treatment with efavirenz, lamivudine and tenofovi disoproxil fumarate tablets and for 12 weeks after stopping treatment. A barrier form of birth control should always be used along with another type of birth control. If you are able to become pregnant, your healthcare provider should do a pregnancy test before you start efavirenz, lamivudine and tenofovir disoproxil fumarate tablets.

Pregnancy Registry. There is a pregnancy registry for women who take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets during pregnancy. The purpose of this registry is to collect information about the health of you and your baby. Talk to your healthcare provider about how you can take part in this registry.
are breastfeeding or plan to breastfeed. Do not breastfeed if you take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets.

You should not breastfeed if you have HIV-1 because of the risk of passing HIV-1 to your baby. Talk to your healthcare provider about the best way to feed your baby. Tell your healthcare provider about all the medicines you take, including prescription and over-the-counter medicines, vitamins and herbal some medicines interact with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Efavirenz, lamivudine and tenofovir disoproxil umarate tablets may affect the way other medicines work, and other medicines may affect how efavirenz, lamivudine and tenofovir disoproxi umarate tablets works. Keep a list of your medicines and show it to your healthcare provider and pharmacist when you get a new medicine.

You can ask your healthcare provider or pharmacist for a list of medicines that interact with efavirenz, lamivudine and tenofovir disoprox Do not start taking a new medicine without telling your healthcare provider. Your healthcare provider can tell you if it is safe to take efavirer amivudine and tenofovir disoproxil fumarate tablets with other medicine

How should I take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets?  $Take\ efavirenz, lamivudine\ and\ tenofovir\ disoproxil\ fumarate\ tablets\ exactly\ as\ your\ health care\ provider\ tells\ you\ to\ take\ it.$ Take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets 1 time each day, preferably at bedtime. Taking efavirenz, lamivudine and tenofovir disoproxil fumarate tablets at bedtime might help to make some of the side effects less bothersome. Take efavirenz, lamivudine and tenofovir disoproxil furnarate tablets on an empty stomach. Do not miss a dose of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. If you miss a dose, take the missed dose as soon as

you remember. If it is almost time for your next dose of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, do not take the missed dose. Take the next dose at your regular time. Stay under the care of your healthcare provider during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Do not run out of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. The virus in your blood may increase and the virus may become harder to treat. When your supply starts to run low, get more from your healthcare provider or pharmacy. If you take too much efavirenz, lamivudine and tenofovir disoproxil fumarate tablets, go to the nearest hospital emergency room right away

What should I avoid while taking efavirenz, lamivudine and tenofovir disoproxil fumarate tablets? ou should avoid taking medicines that contain sorbitol during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. What are the possible side effects of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets?favirenz, lamivudine and tenofovir disoproxil fumarate tablets may cause serious side effects, including:

See "What is the most important information I should know about efavirenz, lamivudine and tenofovir disoproxil fumarate tablets?"
Build-up of an acid in your blood (lactic acidosis). Lactic acidosis can happen in some people who take efavirenz, lamivudine and tenofovi disoproxil fumarate tablets. Lactic acidosis is a serious medical emergency that can lead to death. Call your healthcare provider right away

if you get any of the following symptoms that could be signs of lactic acidosis: feel very weak or tired feel cold, especially in your arms and legs feel dizzy or lightheaded trouble breathing o have a fast or irregular heartbeat

o unusual (not normal) muscle pain o stomach pain with nausea or vomiting Severe liver problems can happen in people who take efavirenz, lamiyudine and tenofovir disoproxil fumarate tablets. In some cases, these

severe liver problems can lead to death. Your liver may become large (hepatomegaly) and you may develop fat in your liver (steatosis). Inflammation of your liver (hepatitis) that can lead to liver failure requiring a liver transplant has been reported in some people treated with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Your healthcare provider may do blood tests to check your liver before and during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets.

Call your healthcare provider right away if you get any of the following signs or symptoms of liver problems: o your skin or the white part of your eyes turns o loss of appetite for several days or long o nausea and vomiting vellow (jaundice) o dark or "tea-colored" urine o pain, aching, or tenderness on the right side of your stomach-area o light-colored stools (bowel movements) confusion weakness o stomach (abdomen) swelling tiredness You may be more likely to get lactic acidosis or serious liver problems if you are female or very overweight (obese) New or worse kidney problems, including kidney failure. Your healthcare provider may do blood and urine tests to check your kidneys before and during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Tell your healthcare provider if you ge

or feet, broken (fractured) bones, muscle pain or weakness Serious mental health problems. Get medical help right away if you get any of the following symptoms: feel sad or hopeless o have thoughts of hurting yourself (suicide) or o feel anxious or restless have tried to hurt yourself or others do not trust other people o are not able to tell the difference between what is o hear or see things that are not real true or real and what is false or unreal Nervous system symptoms are common in people who take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets and can be

signs and symptoms of kidney problems, including bone pain that does not go away or worsening bone pain, pain in your arms, hands, legs

severe. These symptoms usually begin during the first or second day of treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets and usually go away after 2 to 4 weeks of treatment. Some symptoms may occur months to years after beginning efavirenz, lamivudine and tenofovir disoproxil fumarate tablets therapy. These symptoms may become worse if you drink alcohol, take a medicine for mental health problems, or use certain street drugs during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets Symptoms may include: trouble concentrating dizziness o trouble sleeping o drowsiness o unusual dreams o lack of coordination or balance

 $you have \ dizziness, trouble \ concentrating \ or \ drows in ess, \ do \ not \ drive \ a \ car, use \ machinery, \ or \ do \ anything \ that \ needs \ you \ to \ be \ alert.$ me nervous system symptoms (e.g., confusion, slow thoughts and physical movement, and delusions [false beliefs] or hallucinations [seeing or hearing things that others do not see or hear]) may occur months to years after beginning efavirenz, lamivudine and tenofovir disoproxil umarate tablets therapy. Promptly contact your health care provider should any of these symptoms occur. Skin reactions and allergic reactions. Skin reactions or rash can happen and can sometimes be severe. Skin rash usually goes away

without any change in treatment. If you develop a rash or a rash with any of the following symptoms, call your healthcare provider right mouth sores swelling of your face o red or inflamed eyes

 blisters or skin lesions Risk of inflammation of the pancreas (pancreatitis). Children may be at risk for developing pancreatitis during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets if they have taken nucleoside analogue medicines in the past

 have a history of pancreatitis have other risk factors for pancreatitis Call your healthcare provider right away if your child develops signs and symptoms of pancreatitis including severe upper stomach-

area pain, with or without nausea and vomiting. Your healthcare provider may tell you to stop giving efavirenz, lamivudine and tenofor disoproxil furnarate tablets to your child if their symptoms and blood test results show that your child may have pancreatitis. **Seizures.** Seizures are more likely to happen if you have had seizures in the past. Increases in blood fat levels (cholesterol and triglycerides). Your healthcare provider will check your blood fat levels before and during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Bone problems can happen in some people who take efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Bone problem

include bone pain, softening or thinning (which may lead to fractures). Your healthcare provider may need to do tests to check your bones. Tell your healthcare provider if you have any bone pain, pain in your hands or feet, or muscle pain or weakness during treatment with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Changes in your immune system (Immune Reconstitution Syndrome) can happen when you start taking HIV-1 medicines. Your immune system may get stronger and begin to fight infections that have been hidden in your body for a long time. Tell your healthcare provider if you start having new symptoms after starting your HIV-1 medicine.

Changes in body fat can happen in some people who take HIV-1 medicines. These changes may include increased amount of fat in the upper

back and neck ("buffalo hump"), breast, and around the main part of your body (trunk). Loss of fat from the legs, arms, and face may also happen. The cause and long-term health effects of these conditions are not known. Changes in the electrical activity of your heart called QT prolongation. QT prolongation can cause irregular heartbeats that can be life threatening. Tell your healthcare provider if you feel faint, lightheaded, dizzy, or feel your heart beating irregularly or fast during treatmen with efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. e most common side effects of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets are: trouble concentrating o abnormal dreams

o headache o nausea not feeling well o tiredness o nasal signs and symptoms diarrhea o dizziness o trouble sleeping depression o weakness ell your healthcare provider if you have any side effect that bothers you or that does not go away.

ese are not all the possible side effects of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets. Call your doctor for medical advicabout side effects. You may report side effects to FDA at 1-800-FDA-1088. How should I store efavirenz, lamivudine and tenofovir disoproxil fumarate tablets' Store efavirenz, lamivudine and tenofovir disoproxil fumarate tablets at 20° to 25°C (68° to 77°F). Keep efavirenz, lamivudine and tenofovir disoproxil fumarate tablets in the original con Keep efavirenz, lamivudine and tenofovir disoproxil fumarate tablets and all medicines out of the reach of children.

General information about the safe and effective use of efavirenz, lamivudine and tenofovir disoproxil fumarate tablets.

Medicines are sometimes prescribed for purposes other than those listed in a Patient Information leaflet. Do not use efavirenz, lamivudine and enofovir disoproxil fumarate tablets for a condition for which it was not prescribed. Do not give efavirenz, lamivudine and tenofovir disoproxil umarate tablets to other people, even if they have the same symptoms that you have. It may harm them. If you would like more information, talk with your healthcare provider. You can ask your pharmacist or healthcare provider for information about efavirenz, lamivudine and tenofovi disoproxil fumarate tablets that is written for health professionals. What are the ingredients in efavirenz, lamivudine and tenofovir disoproxil fumarate tablets? Active ingredients: efavirenz USP, lamivudine USP, and tenofovir disoproxil fumarate

Inactive ingredients: croscarmellose sodium, hydroxypropyl cellulose, lactose anhydrous, magnesium stearate, microcrystalline cellulose pregelatinized starch, polyethylene glycol, polyvinyl alcohol, sodium lauryl sulfate, talc and titanium dioxide.  $Brands\ listed\ are\ the\ trademarks\ of\ their\ respective\ owners\ and\ are\ not\ trademarks\ of\ Laurus\ Labs\ Limited\ or\ Laurus\ Generics\ Inc.$ For more information, call Laurus Generics Inc. at 1-833-3-LAURUS (1-833-352-8787) This Patient Information has been approved by the U.S. Food and Drug Administratio Manufactured for:
